

LINEA DEL TIEMPO DE LA EVOLUCION DEL MICROSCOPIO

1590: En Middelburg (Holanda), Juan y Zacharias Janssen construyen el que sería el primer microscopio compuesto de la historia. De una simplicidad absoluta el mismo consistía en dos lentes soportados en sendos tubos de latón de unos 25 cm de largo que se deslizaban (facilitando el enfoque) dentro de otro.

1612: Galileo Galilei incursiona en el trabajo con lentes. Ya lo había hecho con los telescopios y los microscopios no quedaron al margen de su creatividad. Es así que fabrica uno de pequeño tamaño (unos 12 cm) instalando dos lentes en sendos tubos de madera que se deslizaban dentro de uno exterior de cartón al que se le practicaron terminaciones en cuero al estilo de la época.

1632: En Leyden (Holanda), Antoni van Leeuwenhoek, fabrica un microscopio simple de unos 10 cm con el que logró convertirse en el descubridor de los eritrocitos.

1665: Giuseppe Campana genera un salto cualitativo, ya que construye un microscopio de 9 cm donde el avance sustancial lo aporta un mecanismo de tornillo que facilita el desplazamiento mejorando notablemente la calidad del enfoque y una base circular de madera con un orificio central que permitía observar por transparencia.

1668: Eustachio Divini, en Bologna (Italia), desarrolla un microscopio compuesto de mayor porte. El sistema estaba basado en tubos telescopados. En la parte superior del mismo colocó dos lentes enfrentados desde su lado convexo; mientras que, en la parte inferior ubicó un lente montado sobre madera. La estructura estaba sostenida sobre un pie metálico.

1670: Christopher Cock y Robert Hooke, uno aportando la construcción y el otro el diseño, son los responsables de la creación de un microscopio compuesto de 50 cm con el que Hooke logró observar celdillas de corcho a las que denominó "célula", instaurando por primera vez el uso de esta palabra.

1680: La estructura microscópica del tejido óseo es observada a través de un microscopio simple por Juan Cristóbal Martínez.
